Discover the groundbreaking, non-invasive technology for accurate, rapid diagnosis and treatment of cardiovascular conditions

Corporates

Introduction

Cardiovascular diseases are among the leading causes of death globally, making early detection and appropriate treatment **Case Studies** crucial for improving patient outcomes. Cardisio, a pioneering company in the field of heart disease diagnostics, has introduced Cardisography (CSG), a cutting-edge technology designed to identify blood flow disorders in the heart quickly, accurately, and non-invasively. This innovative method enables healthcare professionals to provide precise information to patients, helping to prevent severe consequences such as heart attacks, sudden cardiac death, and ventricular fibrillation. **Content Hub**

Cardisography for Primary Care Physicians and Cardiologists

Cardisography has been specifically developed for use by internal medicine physicians and cardiologists to rapidly, accurately, and non-invasively diagnose or rule out heart diseases. The measurement technology behind CSG meets the highest modern standards, offering significantly greater sensitivity (> 90%) compared to stress ECG (45-50%) without its drawbacks. This increased sensitivity allows for the early selection of appropriate treatment paths.

Key Benefits of Cardisography

1. Non-invasive: Cardisography is performed during the patient's resting state and does not require any invasive procedures.
2. Fast results: Results are obtained within a short period (approximately 10 minutes for both the procedure and the outcome).
3. Billing: Secure billing through the German Schedule of Fees (GOÄ) codes 657 and A658 and within the HzV.
4. Efficiency: Cardisography boasts a sensitivity rate of over 90% (compared to 45-50% for stress ECG).

trips, post-COVID-19 infection, etc.

- 3. Suspicion: Suspected structural heart diseases, arrhythmias, or coronary heart disease (CHD)/ischemia.

Conclusion

Cardisio's groundbreaking Cardisography technology offers a promising solution for the early detection and management of heart diseases. Its non-invasive nature, speed, and accuracy make it a valuable diagnostic tool for healthcare professionals. By revolutionizing the way we diagnose and treat cardiovascular conditions, Cardisography has the potential to save countless lives and improve overall patient care.
